Contents

---

buildr_client   *buildr Client*

Description

Client for submitting and retrieving packages from a buildr server.

Usage

```
buildr_client(host, port = 8765)

buildr_available(host, port = 8765)
```

Arguments

host   Hostname that the buildr server is running on

port   Port that the buildr server is running on (the default here matches the buildr
                server default)

---

build_binaries   *Build a set of binaries, waiting until complete*

Description

Build a set of binaries, waiting until complete

Usage

```
build_binaries(filenames, host, port = 8765, ..., dest = tempfile())
```

Arguments

filenames   Vector of filenames of the source packages

host   A hostname for the build server, or FALSE to build locally.

port   Port number for the build server

...   Arguments passed through to the build method of [buildr_client](#); includes
                dest (place to put binaries), poll (frequency to poll for job completion), timeout
                (time until giving up), verbose (controls printed output) and log_on_failure
                (print logs if a build fails).

Value

A character vector of filenames
